

Give your customers the V-IP experience with future-proof voice

Prepare for the All-IP world with our Single Line Voice solution, V-IP Essentials, our direct replacement product for traditional voice services.

In the biggest change to telecoms in a generation, the PSTN and ISDN are closing, meaning no more landlines or copper-based solutions. Until now, broadband connectivity required two products: a telephone line and a broadband package. As we move into the All-IP future, Single Order, data-only broadband will be the only connection needed while voice becomes an over-the-top solution.

Voice over IP (VoIP) is now the standard application for business uses, but for many micro businesses, the feature-rich licences for hosted voice are too elaborate and expensive, meaning paying for many functions they don't need.

With V-IP Essentials, businesses can embrace the All-IP future with a basic voice solution that delivers the call features and quality that they are used to.
